Resources and Support

The MPCA is collaborating with the Midwest Assistance Program, Minnesota Rural Water, and staff at the Minnesota Technical Assistance Program to provide technical assistance to small, rural, and tribal wastewater facilities. This work is made possible by funding from the federal Infrastructure Investment and Jobs Act. The program will provide outreach and technical assistance to small, rural, or tribal wastewater facilities focusing on permitting support, financial assistance, guidance, pollutant identification and reduction plan development, and evaluation of facility operations.

Challenges are complex

Solutions are not easy

Listening to each other & finding innovative solutions is key to success

MPCA Technical Assistance for small, rural, and tribal WWTFs

- Permit support (eDMRs)
- Clean Water Revolving Fund applications and public processes
- Pollutant identification and management plans
- Technical, managerial, and financial capacity (TMF)
- Technical evaluations of facility operation
- Process optimization
- Climate resiliency
- Energy efficiency
- Rate studies
- Standard operating procedures
- Emergency response plans
- Site sampling plans

Engineering and technical information for construction or expansion

The MPCA is collaborating with the Midwest Assistance Program, Minnesota Rural Water, and staff at the Minnesota Technical Assistance Program to provide technical assistance to small, rural, and tribal wastewater facilities. This work is made possible by funding from the federal Infrastructure Investment and Jobs Act. The program will provide outreach and technical assistance to small, rural, or tribal wastewater facilities focusing on: permitting support; financial assistance guidance; pollutant identification and reduction plans; building technical managerial and financial (TMF) capacity; technical evaluation of facility operations; optimization; climate resiliency; and energy efficiency solutions.

Request technical assistance

Use this brief form to gather information to prioritize support to wastewater facilities in communities of smaller than 10,000 people.

Biosolids PFAS Sampling, Analysis and Reporting Guidance

A guide to sampling, analyzing, and reporting on PFAS in biosolids that are intended to be land applied in Minnesota.

Content was developed collaboratively based on EPA Method 1633A, the Minnesota Pollution Control Agency's [Guidance for Per- and Polyfluoroalkyl substances \(PFAS\): Sampling](#) and from other state's resources and programs that have already begun to sample biosolids for PFAS. The guidance was also reviewed by an independent third-party.

PFAS Source Identification Grants

~40 Awardees in 4 categories;

- Municipal Wastewater
 - Sewershed mapping, Identify industrial or commercial contributors, Collection system sampling, Waste stream sampling, Biosolids sampling, Contributor outreach, Public outreach
- Industrial Wastewater
 - Product Sampling Waste stream sampling Customer Notification
- Airports
 - Product substitution, Equipment Substitution
- Landfills
 - Waste study to determine residential levels of PFAS in MSW

Deadlines

Grant closed:
May 22, 2025

Work Completed by:
Dec. 18, 2026

Final reports due by:
June 2027

PFAS Planning and Design Grants

Technology	Type
Pyrolysis	Destruction
Foam fractionation	Treatment
Electrochemical oxidation	Destruction
Microbial & geochemical assessments and bioreactor	Treatment
Bauer Torrent Units - RO & oxidation	Destruction & Treatment
Evaporation and RO	Treatment
Foam Fractionation	Treatment
Foam Fractionation and SCWO	Destruction & Treatment
SCWO, Electrochemical Oxidation and Incineration	Destruction

Current Sampling Projects

- Class 1 Water Dischargers & Major Facilities
 - 22 POTWs
 - No significant industrial users
 - Influent
 - Average PFOA 3.33 ug/l
 - Average PFOS 4.46 ug/l
 - Biosolids
 - Average PFOA 8.02 ug/kg
 - Average PFOS 11.39 ug/kg
- Domestic Hauled Waste
- Residential Septic Tank
 - 2 of 22 samples detected PFOA
 - 20 of 22 samples detected PFOS
- Domestic Holding Tank
 - 5 of 15 samples detected PFOA
 - 13 of 15 samples had PFOS
- Portable Toilet Waste
 - 0 of 13 samples had PFOA
 - 10 of 13 sample had PFOS

How to talk to your community about PFAS

- Communications toolkit: PFAS reduction and Amara's Law
 - Powerpoint slides, social media graphics, videos, talking points, etc
- PFAS studies and reports: PFAS source eval and reduction
 - PFAS desktop screening tool
 - PFAS industrial search tool
 - Trifold mailing in English, Hmong, Somali, Spanish

What can you do to reduce PFAS use?

PFAS are difficult to avoid because they are found in so many items, and product labels generally won't tell you if they contain PFAS. Fortunately, some companies are beginning to use safer alternatives to PFAS in their products.

Be aware of products that are likely to include PFAS

Types of products that often include PFAS are: outdoor gear, waterproof apparel, shoes, cosmetics, furniture, food packaging, non-stick cookware, and carpet.

- ▶ Key words to watch for: non-stick, grease/oil/water resistant, breathable, and stain-proof.
- ▶ Ask sales staff and manufacturers if a product contains any PFAS.

Seek a PFAS-free option

- ▶ Review online sources for similar products that don't contain PFAS. Consider products advertised as PFAS-free.
- ▶ PFOA and PFOS are two types of PFAS, but there are thousands more. "PFOA- and PFOS-free" doesn't necessarily mean PFAS-free.

We are learning more about PFAS every day, but there are resources available for you to learn more about the issue, what is being done in Minnesota, and new laws about PFAS. Beginning in 2025, many products containing PFAS will be prohibited in Minnesota.

For the most up-to-date information, visit MPCA's website:

PFAS in Minnesota

www.pca.state.mn.us/pfas-in-minnesota

Forever chemicals in consumer products:

Tips to avoid PFAS in your purchases

WHAT are PFAS?

Per and polyfluoroalkyl substances (PFAS) are a family of human-made chemicals. They are known for their water and oil repellency, heat resistance, and other useful properties, and have been used in manufacturing since the 1950s.

Today, they can be found in many products we use in our day-to-day lives.

PFAS can be found in:

Cosmetics

Stain resistant products

Paints

Cleaning products

Fast food packaging

Non-stick cookware

Dental floss

Clothing

WHY

do we care about PFAS?

PFAS are often called “forever chemicals” because they do not break down in the environment and are difficult to treat.

Some PFAS build up in the human body over time and can be harmful to health even in small amounts.

Use of PFAS-containing products can eventually lead to PFAS found in air, water, and land. People can be exposed to PFAS through drinking water, eating food, or inhaling dust that is contaminated with PFAS.

HOW do PFAS from consumer products enter the environment?

While industrial sources and the use of PFAS-containing firefighting foam are large sources of PFAS pollution, **consumer products containing PFAS are a problem too.**

Using PFAS-containing products in our everyday lives leads to **PFAS in wastewater streams and landfills.**

Eventually this PFAS can pollute soil, groundwater, surface water, fish, and **ultimately our drinking water and food supply.**

Questions?

Nitrogen

In-state

Aquatic life toxicity, drinking water

Out-of-Minnesota Waters

Downstream

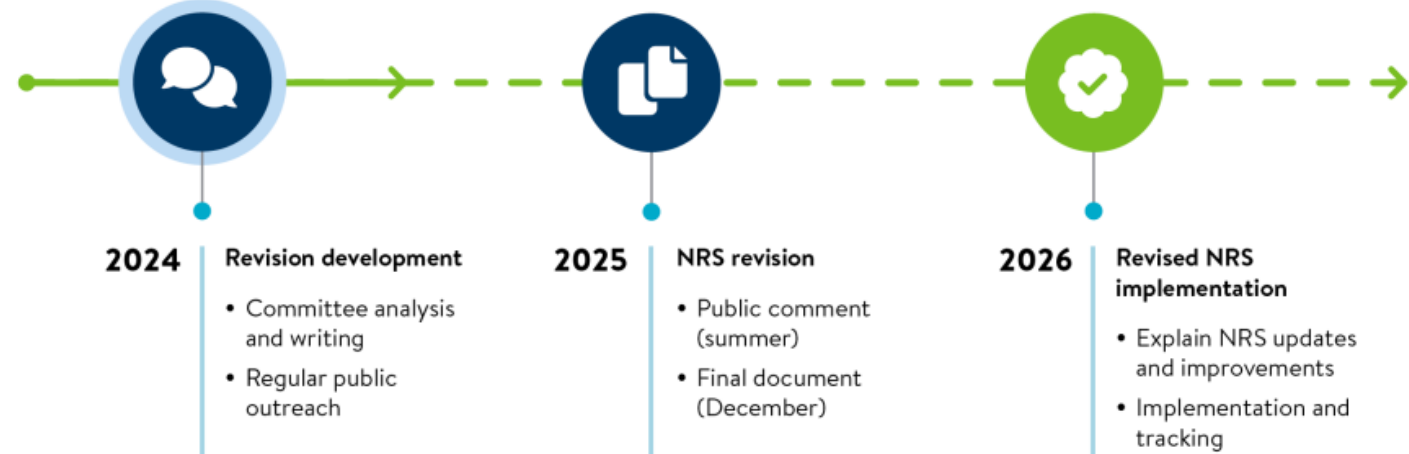

Low oxygen (south), algae blooms (north), drinking water

Minnesota Nutrient Reduction Strategy

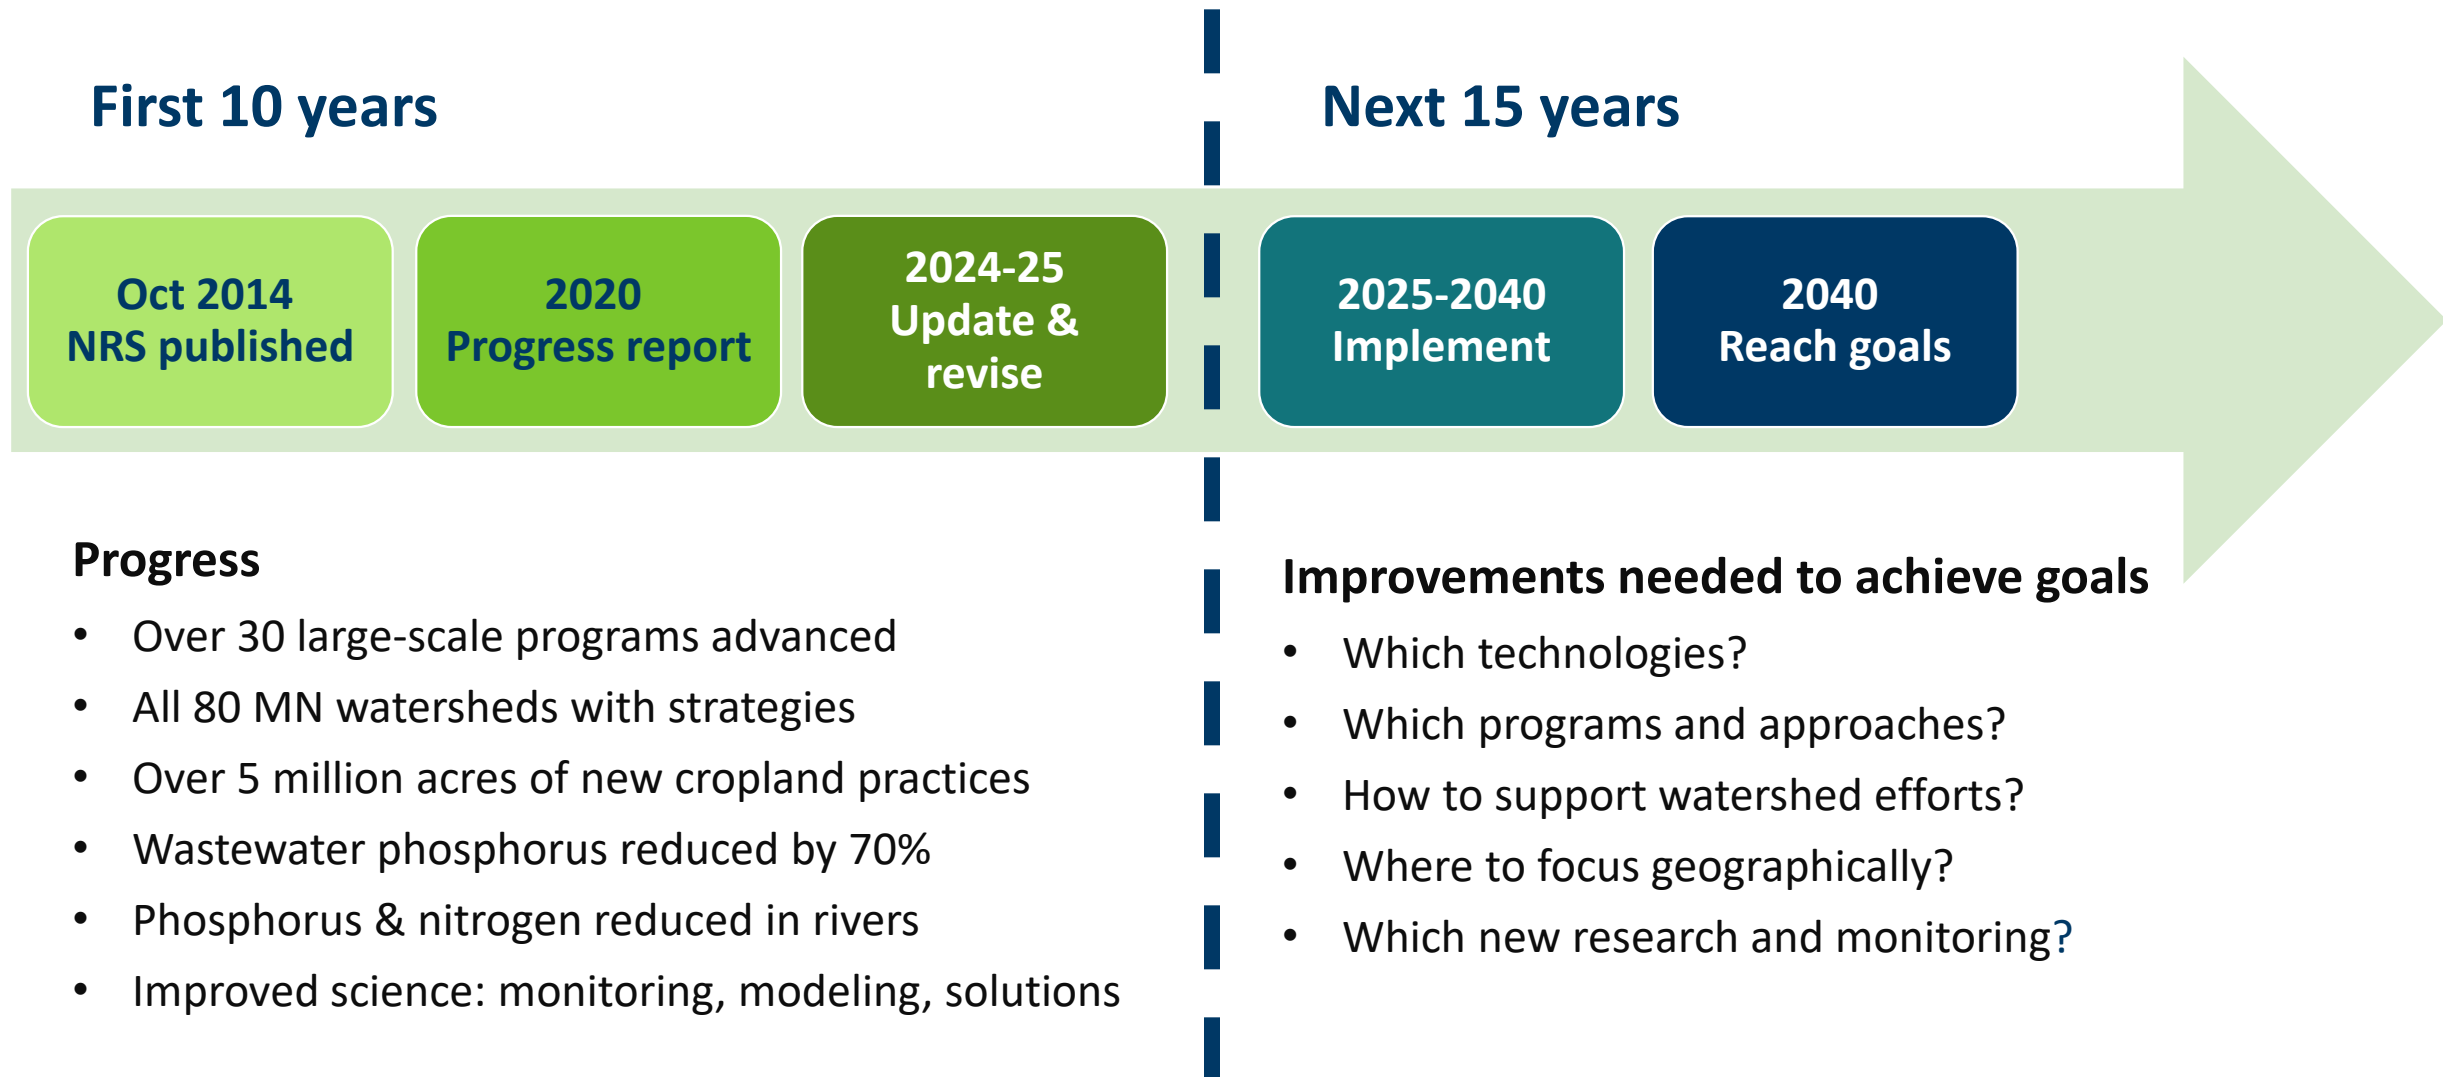

- Compiles the latest science, research, and data
- Establishes phosphorus and nitrogen reduction goals
- Includes voluntary & regulatory actions to reduce nutrients from point & nonpoint

Ten Year Revision Schedule

Much progress since 2014 – much more needed before 2040

Updating and strengthening 24 building blocks

Six working groups

Water loads, goals & priorities	Urban nutrients	Agricultural BMP science	Agric BMP adoption	Watershed support/tools	Progress tracking
River loads & trends analysis	Wastewater data analysis	BMP efficiency science	Approaches to scale-up BMPs	Mining WRAPS & 1W1Ps	Water changes dashboard
Priority areas for in-state needs	Wastewater technologies	BMP combination scenarios	BMP socio-economics	Watershed tools survey	BMP adoption tracking
Nutrient sources verification	Stormwater science/data	Research needs identification	Maximum practical BMP increases	Local staff needs assessment	Priority metrics and measures
Goals update	Wastewater N strategies	Nutrient balance on land analysis	Existing programs analysis	Watershed load reduction needs	Permit program dashboard

Nitrogen reduction example practices for Mississippi River – what will it take in Minnesota?

Nitrogen		
Practice type	Acres added (millions)	TN Load reduction (lbs/yr at state line)
Tile water management	3.0 M	13.8 M
Fertilizer & manure mgmt.	2.8 M	4.4 M
Continuous living cover	7.8 M	33.4 M
Overland runoff controls	1.2 M	1.3 M
Tillage with more residue	2.0 M	2.0 M
Streambank/flood plains	TBD	7.0 M
Urban wastewater N		11.0 M
Other	TBD	5.0 M
TOTAL	17+ M acres	78 M lbs TN

Nutrient Reduction Strategy

- Public comment period: **July 14 – August 28, 2005**

Information sessions

Learn about the draft NRS 2025 update at the July 15 overview webinar and ask questions at the July 24 Q&A event.

July 24 Q&A

Wastewater Nitrogen Reduction Strategy

<https://www.pca.state.mn.us/business-with-us/nitrogen-in-wastewater>

- Finalized in April 2024
- Nitrogen Management Plans
- Implement existing Class 1 standard
- Design considerations for denitrification
- Future rulemakings to adopt standards
 - Implementation in permits upon adopted

The screenshot shows the Minnesota Pollution Control Agency (MPCA) website. The header includes the MPCA logo and navigation links: Air, Water, Land, Climate; Trending Topics; Business With Us; Get Engaged; and About MPCA. Below the header is a breadcrumb trail: Business With Us / Permits and regulations / Water permits / Wastewater permits / Wastewater permit additional guidance and information. The main heading is 'Nitrogen in wastewater'. A sidebar on the left contains links: '< WASTEWATER PERMIT ADDITIONAL GUIDANCE AND INFORMATION', 'Minnesota River Basin: General phosphorus permit phase 1', 'Nitrogen in wastewater' (highlighted), 'Nitrogen management plans', 'Phosphorus in wastewater', and 'Regulatory certainty for wastewater treatment facilities'. The main content area discusses the harm of excess nitrogen and the MPCA's strategy to reduce it. It includes a section on 'Statewide sources' and a 'Nutrient loads and flow volumes' tool.

Nitrogen in wastewater

Excess nitrogen in our state's waters is harmful to human health and aquatic life, and can contribute to algal blooms and low oxygen zones in downstream waters. Nitrogen concentration in rivers has been increasing from historic natural levels due to human influences. In consultation with stakeholders, the MPCA developed the Wastewater Nitrogen Reduction and Implementation Strategy to start implementing actions that reduce wastewater nitrogen loads needed to protect aquatic life and achieve Minnesota's nitrogen reduction goals.

Statewide sources

Drinking water in the state is protected by existing nitrogen water quality standards. In other bodies of water, nitrogen also causes adverse effects to aquatic life and contributes to national and international nutrient issues that the Gulf of Mexico Hypoxia Task Force and the International Red River Watershed Board are working to address. [Minnesota's Nutrient Reduction Strategy](#) addresses sources of nitrogen for Minnesota's waterways and establishes a plan to successfully reach our goals.

Although nitrogen discharged by wastewater treatment facilities is less than 10% of the total nitrogen in Minnesota waters, some wastewater treatment facilities discharge nitrate concentrations at levels that can be harmful for aquatic organisms. Wastewater is typically the highest source of nitrogen to waters in areas where there is relatively little farmland, during low flow months, and in some cases to small rivers and streams.

Based on a review of data collected since 2014, municipal wastewater treatment facilities discharge the majority (92%) of the wastewater sector's nitrogen loads. Industrial facilities discharge a smaller proportion of the overall nitrogen load (8%), although some industrial discharges are significant.

Nitrogen concentrations discharged from wastewater treatment facilities have increased by 16% during the lower flow period from 2020 through 2023 compared to the decade prior.

Nutrient loads and flow volumes

Tool shows estimations of nitrogen and phosphorus discharge from wastewater treatment facilities around Minnesota.

[Launch tool](#)

Questions?

Wild rice is important, and it needs to be protected

The 10 mg/L sulfate standard to protect wild rice was adopted in 1973

2010 – 2017 Research and rulemaking efforts took place

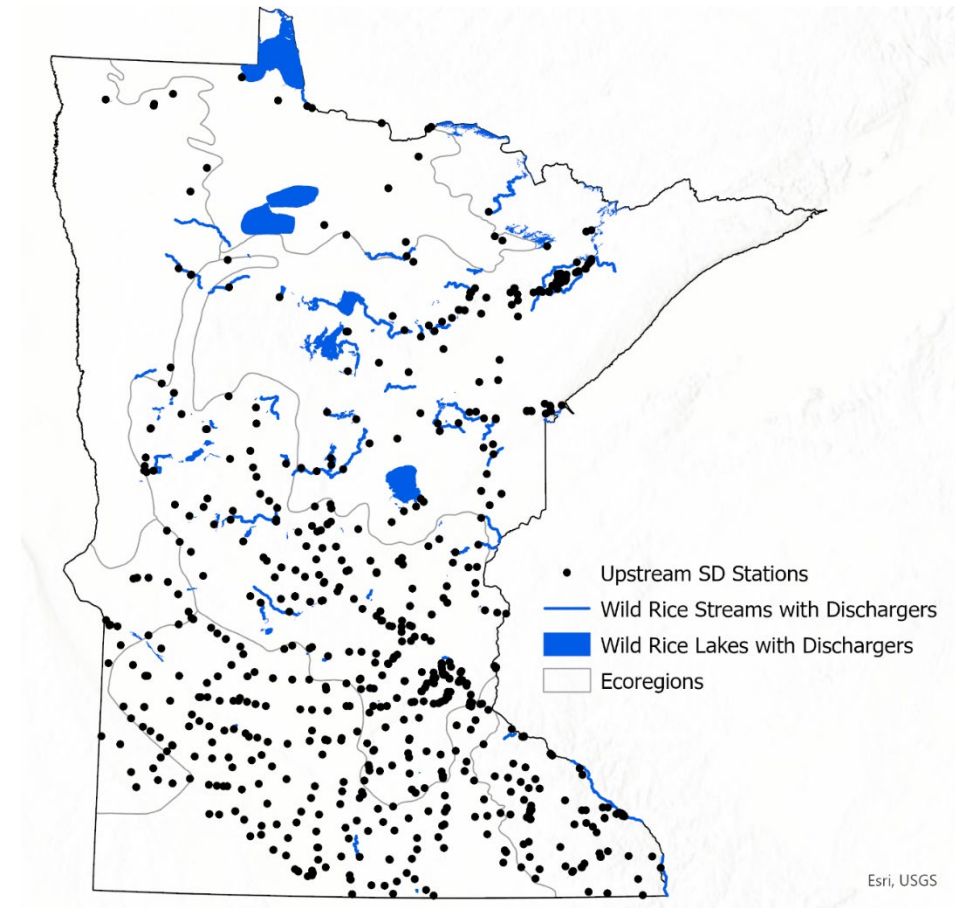

In 2022, MPCA was directed to implement existing standard

Wild rice sulfate
standard

Permitting approach

- 576 Wastewater facilities discharge upstream of a “Waters Used for the Production of Wild Rice”
 - If upstream → monitor
 - If you’ve already monitored → reasonable potential evaluation
- Tools are available online to locate your facility in relation to the waters
- Time, flexibility & other tools are key to implementation efforts.
 - Compliance Schedules
 - Water Quality Variances: Individual or Multi-Discharger

Implementing the standard in permits: monitoring data

379 permits with sulfate monitoring

– ~331 Municipal, ~48 Industrial

Implementing the standard in permits: RP reviews

Total: 106 Reasonable Potential reviews since 2015

- 9% of NPDES permits have been evaluated.

Wastewater permits evaluated for sulfate reasonable potential

Implementing the standard in permits

- In 2024:
 - 1 permit issued with an effective sulfate limit
 - 2 permits with sulfate compliance schedules
- Many permits on hold waiting for variances
- Current Variance Applications
 - 24 Domestic, 3 Industrial

Variances in Minnesota

True Individual

- Permittee conducts analysis of treatment options
- Permittee identifies eligibility based on federal rule

Streamlined Individual

- MPCA determines the applicable eligibility and conducted general alternative analyses for most common alternatives for the facilities

Multi-discharger Variances (MDV)

- MPCA carries out alternatives analysis and eligibility considerations for similar facilities and defines each eligible discharge and its downstream water.

Minnesota's sulfate MDV

This variance will apply to several facilities,
but it is not a statewide variance

MPCA is still refining eligibility factors

Some facilities will not be eligible for the MDV, they
can request an individual variance

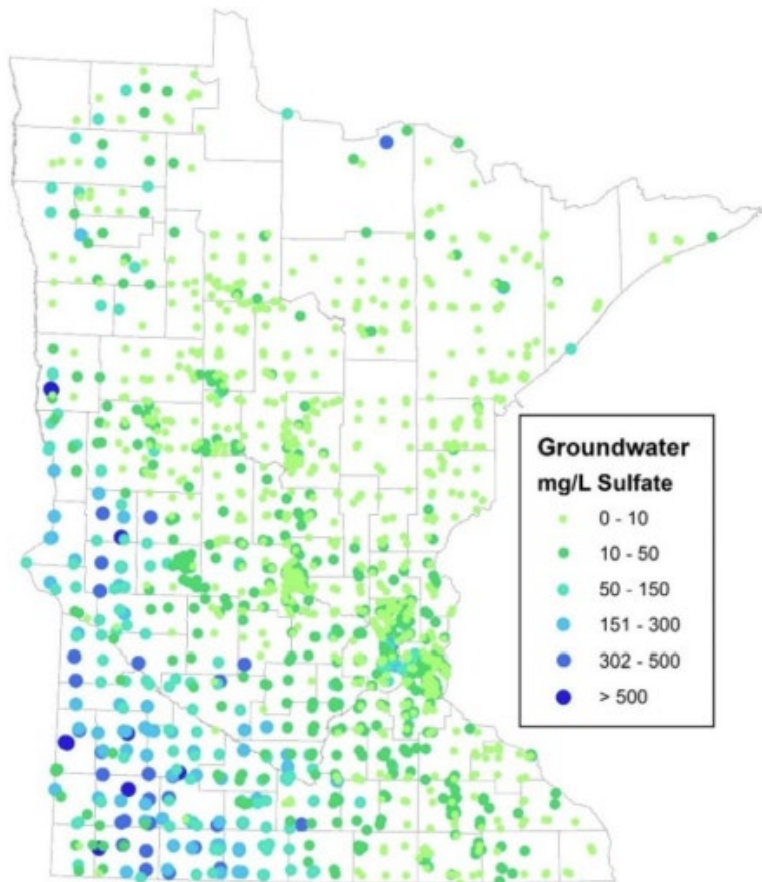

MPCA Sulfate MDV Approach

- Humans inhabit areas of the state that have naturally high levels of sulfate. There are not available water sources in those portions of the state that would induce compliance with the WQBEL.
- Some amount of sulfate $\sim 20\text{-}80$ mg/L are added in a WWTF collection system as a function of human actions (personal care products etc.).
- The downstream water body offers no assimilative capacity, due to circumstances not associated with the permittee.
- The only viable alternative to remove sulfate is RO/Crystallization, which is unaffordable by many
- Still determining which/if industrial facilities will be eligible.

Sulfate Levels

Ground water sulfate concentrations

Surface water sulfate concentrations

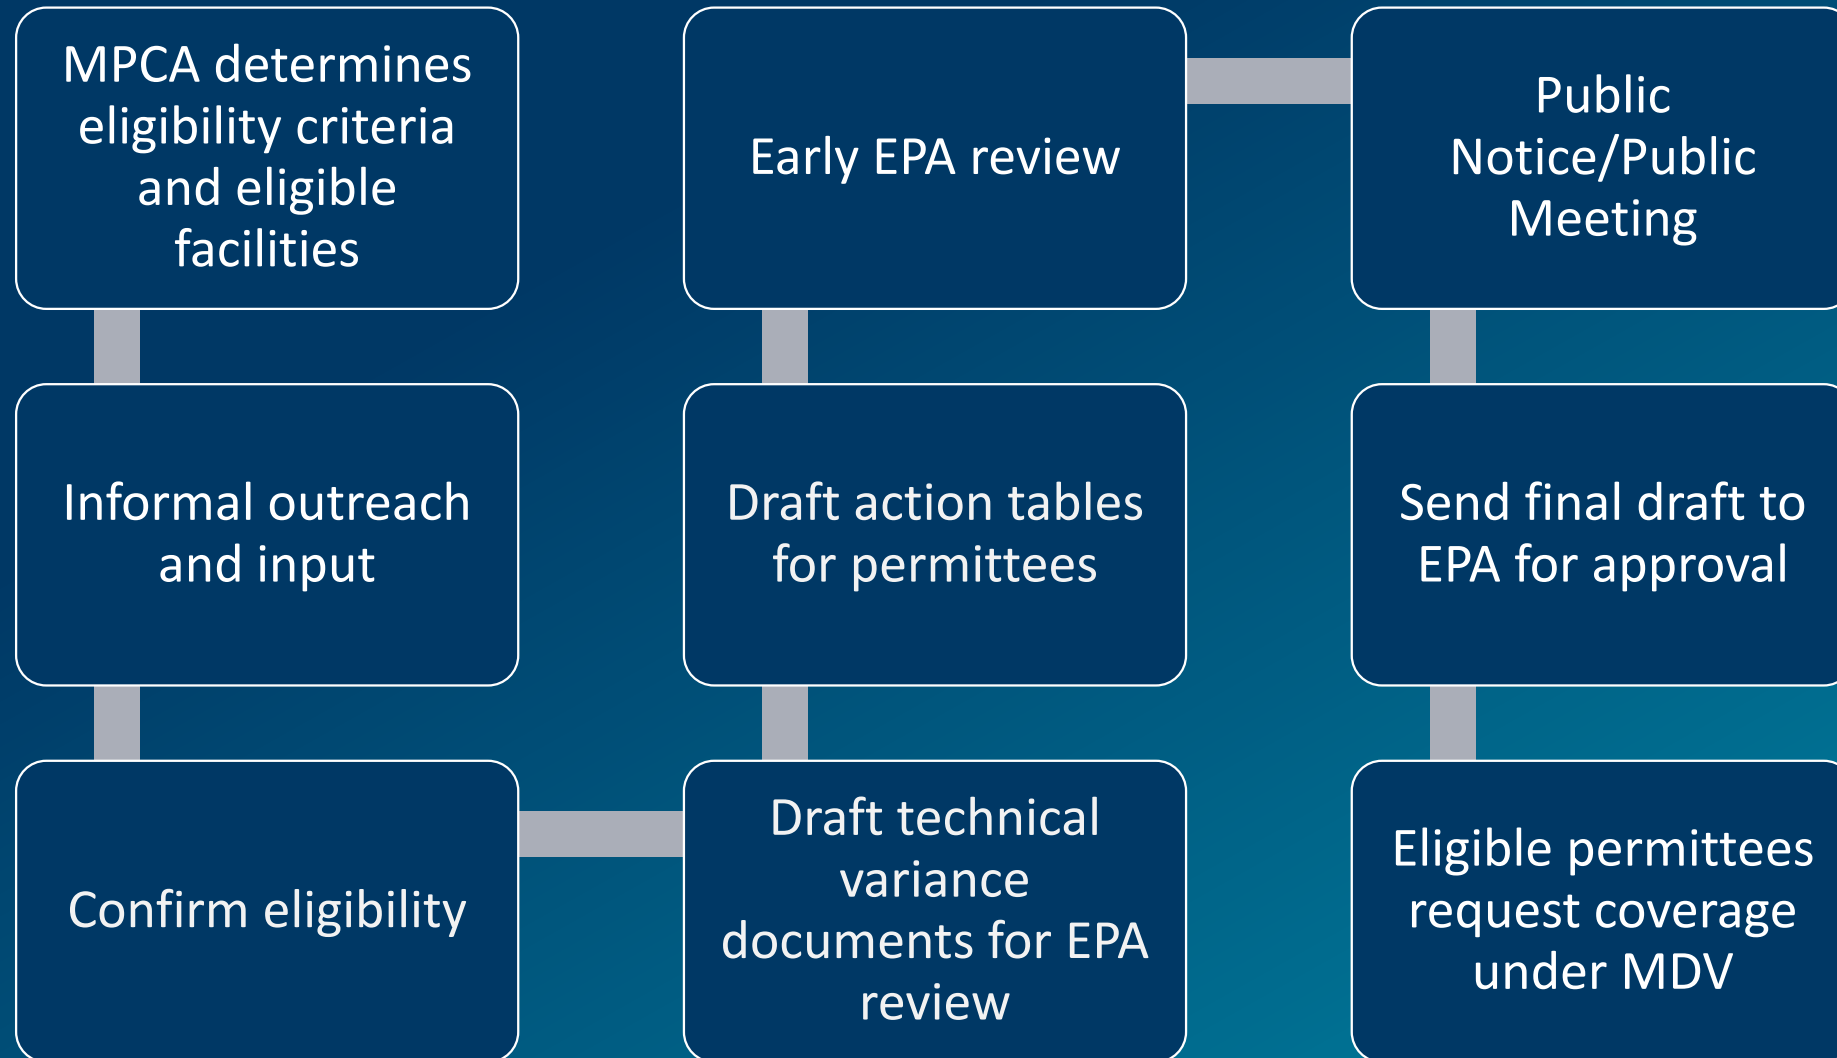

Implementing the standard in permits: meeting limits

6 Variance Eligibility Criteria

1. Naturally occurring pollutants prevent attainment of water quality standards.
2. Natural physical features of a stream prevent attainment of water quality standards.
3. **Human-caused pollutants cannot be remedied or would cause more environmental damage to correct.**
4. Hydrologic modifications prevent attainment of water quality standards.
5. Flow conditions or water levels prevent attainment of water quality standards.
6. **Controls to reduce pollutant would cause substantial and widespread economic and social impact.**

Sulfate MDV process

Next Steps

- Seeking and considering input
 - Permittees, Tribal Nations, Watershed Groups
 - Expected Fall 2025
- Finalize documentation, criteria, etc
- EPA Review
- Public Meeting
- EPA Approval

Mississippi River SSS

- MPCA is continuing to evaluate existing data, identifying data needs and working with partners
 - Examining condition and composition of multiple river segments and backwater environments
 - Using historical as well as recently-collected data to understand trends and patterns
 - Working with multiple partners to identify data gaps, collect additional sulfate data, and gather existing data/information on wild rice
- Scope: downstream of Lake Pepin in Pool 4
- Final results are not guaranteed

Thank you!

Permittee Actions during MDV

- Permittees will sample source water, WWTP influent/effluent, and non-point sources under their control
- Permittees will be required to reduce sulfate load when possible
- Permittees will be required to reduce non-point source loads under their control, when possible
- Actions will likely vary based upon facility size
